

Questions JavaScript

Lucas Lumeij - 10353062

1. '==' returns 'true' if you compare two variables with different types, but the same value. However, when using '===' the types have to be similar as well.
2. *Closure* means that bindings within a function will not clash with bindings of other functions, even when they are called together, because these bindings are enclosed and therefore local.
3. Higher order functions are functions that operate on other functions. This means that take other functions as arguments or they return other functions.
4. A query selector returns the first element that matches the selected CCS selector.

`document.querySelector("h1")`

This finds the first element with CSS selector 'h1'.
